

Optical Finger Switches provide an alternative means of cycling the bagger as well as insuring the operator is safely away from the sealing area. Safety is paramount in today's industrial environment, certain applications lend themselves to hand-loading a product into a bag without a funnel. Optical Finger Switches provide that extra assurance that the operator is free of the sealer prior to sealing. The switches can be programmed from the AutoTouch™ Screen for easy set-up between jobs. Both switches have to be made at the same time to further minimizing the risk of an accident.

### User Benefits

- Optical design requires little effort on the operator to cycle the bagger.
- Provides an alternative cycling method to protect the safety of the operator.
- Easily set-up from the AutoTouch Screen
- Conveniently located on the top of the bagger to insure productivity
